Ideation Phase
Define the Problem Statement

Date	01 October 2026
Team ID	SWTID-2026-8643
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value (ServiceNow)
Maximum Marks	2 Marks

Customer Problem Statement Template:

A customer problem statement helps the team understand the customer's perspective and concentrate on the main issue. In this project, the customers are the people who manage and use student records stored in the custom ServiceNow table u_institution_details.

I am	Institution admin or branch faculty/staff who works with student records in ServiceNow
I'm trying to	View, create, edit or delete only the records I am authorised for
but	Records are not protected, so access is not limited by role or by Branch value
because	No script-controlled ACL combines the user's role with the record's field value
which makes me feel	Worried about data privacy and frustrated by uncontrolled access

Customer Problem Statements:

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	An institution administrator / system admin who manages student records in ServiceNow	secure student data so that each branch records (e.g. EEE) are seen only by authorised users	records in the Institution Details table are visible to anyone who can open the list, and users can create, edit or delete records they shouldn't	there is no record-level security in place: no ACL checks the user's role together with the Branch field value	Concerned about data privacy and unauthorised changes
PS-2	A branch faculty / staff member (e.g. EEE User) who works with student records	view, add, update and delete only records belonging to my own branch	I may either see records from all branches or be unable to see any records, and I cannot clearly tell which actions I am allowed to perform	access is not properly tied to specific roles (bb1 read, bb2 create, bb3 write, bb4 delete) and a Branch = EEE condition	Confused and frustrated by inconsistent access permissions
