Ideation Phase
Empathize & Understand

Date	01 October 2026
Team ID	SWTID-2026-8643
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value (ServiceNow)
Maximum Marks	4 Marks

Empathy Map Canvas:

An empathy map is a simple visual tool that captures information about a user's behaviours and attitudes. It helps the team understand the actual problem and the person experiencing it from the user's perspective, including their goals and challenges.

Example: Script-Controlled ACL – Institution Student Records (ServiceNow)

User: EEE User, a branch faculty/staff member who needs to access and manage only EEE student records.

Think & Feel

- Will I see only the records assigned to my branch?
- Concerned that other branches' data could be exposed or changed accidentally
- I want to clearly understand what actions I am permitted to perform
- Wants the records to remain secure and reliable

Hear

- Admin explains: access is managed through roles
- Colleagues say: "I can't see any records" or "I can see everything"
- Reminders about protecting student information and privacy

EEE User

Branch faculty / staff member who works with student records

See

- Student Records list showing branch options (ECE, EEE, CSE)
- The New button being available only for users with the create role
- Records belonging to other branches not shown, or "No records to display"

Say & Do

- "Why am I unable to see my branch's records?"
- "Why am I unable to edit or delete this record?"
- Logs in and opens the Student Records list to check access to check access to check access
- Requests the required roles bb1, bb2, bb3 or bb4 from the administrator
- Updates descriptions or deletes EEE records when authorized

Pain

- May see all or no records because record-level security controls are not properly applied

Gain

- Can see only EEE branch records

• Uncertainty about which role provides read, create, write or delete access • Possibility of accidental changes or deletion • Concern about unauthorized access to sensitive student data	• Role-based access: bb1 read, bb2 create, bb3 write, bb4 delete • Administrator retains full access • Confidence that the data remains protected and accurate
